EXECUTIVE DECISION BRIEF / SIX-MODULE FINAL PROJECT

The average improved. Four responders didn't.

Rook Dispatch needs an explainable way back into consideration for work. A healthier acceptance percentage cannot establish that customers regained access to appropriate callouts.

4 interviews | 147 tickets | 1,696 pings | Original code verified

---

What 4.2 changed: on 12 August, ping wait fell from 90 to 60 seconds and proximity gained routing weight. A willing response can now miss the deadline and enter an existing history-penalty loop with no timed recovery. Controlled code tests reproduce that path; the extract cannot attribute every lost offer to it.

72.7%	49 → 3	0 taken
Final-week acceptance 120 taken / 165 pings	Offers to four affected responders Baseline weekly mean → final week	By those four responders In each of the final two weeks

> **Decision requested from Helen**
>
> Sponsor a bounded readiness-and-recovery pilot for validation. Review the response window separately from history recovery; preserve eligibility, incident escalation and Supply's availability contract.
>
> Read the one-page product brief ↗

Observed metrics cover 29 June–6 September. The mechanism is reproducible in supplied code; complete historical causal attribution remains unverified. Definitions and denominators.

---

02 / TRIANGULATE BEFORE CHOOSING A FIX

Two piles reveal different parts of the service.

The interviews explain lost confidence and operational context. The tickets show repeated breakdowns across more workflows. Both report the core offer

problems.

INTERVIEWS / 4 CONVERSATIONS

“Mite thinks Mite's been forgotten. Gale's exhausted.”

Kip · 4 September 2026

Disappearing offers: **3/4**. Quiet or uneven work: **2/4**. Handler awareness/alert identification: **3/4**. Themes overlap; counts are once per interview.

Full theme matrix and exact excerpts ↗

TICKETS / 147 FILINGS

“Nothing looks wrong on our side. Could someone check yours?”

Ticket #3131 · 3 September 2026

Missing/reduced offers: **30** tickets. Disappearing offers: **15**. The queue is classified into **56 specific issues**; follow-ups are not independent customers.

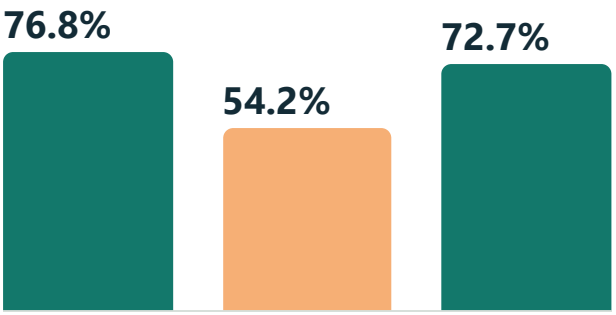

Every ticket, classification and quote ↗

Disagreement means different coverage or experience, not necessarily a contradiction.

SIGNAL	INTERVIEWS	TICKETS	IMPLICATION
Small text/status readability	2/4	2/147	Frequent exposure may not generate repeated support filings.
Overload beside a quiet responder	Kip's explicit contrast	No primary overload report	The queue misses the other side of the allocation story.
Maintenance scheduling	Halloran reports improvement	2 busy-day complaints	Different responders can have different experiences.
Duplicate phone notifications	0/4	3/147	Ticket breadth includes issues absent from these interviews.

Interview and ticket percentages are not comparable prevalence estimates. Only Captain Vantage overlaps the responder samples. Full comparison · Before/after comparison.

A recovery headline needs a second lens.

Baseline	Release	Final week
6 pooled weeks	Mixed week	31 Aug–6 Sep

Taken / all pings. A responder receiving no offer contributes no ping to this denominator.

Farlight, Vesper, The Undertow, Meteor Mite. These four receive 1.8% of final-week offers versus 28.4% of baseline offers.

Different question, different denominator: offer exposure per responder-week. Retain zero-offer weeks.

The number for the Director

Keep the service investigation open: the severe cohort's weekly offers fell 83.0% comparing six baseline weeks with three full post weeks, while other responders' rose 24.3%.

Incident demand fell 11.1% per week. Demand softening alone does not explain the concentration of lost offers, but historical eligibility and availability are unavailable.

> The 49→3 comparison is baseline mean versus final week. The 83.0% decline uses the full post-period mean. These are separate comparisons.

Director brief · Executed SQL · All ping rows

---

03 / INSPECT BEHAVIOR, NOT JUST CONFIGURATION

The code contains a trap with no timed recovery.

A shorter offer window feeds an existing history penalty. Lower rank can remove the very opportunities needed to earn acceptance credit.

01 / WINDOW

90 → 60 seconds

The same controlled 75-second answer changes from taken to missed.

02 / HISTORY

Miss = refusal

Both subtract 0.12. Taking a callout earns only 0.08.

03 / RANK

Someone else accepts

History still weighs 0.25. Dispatch stops offering after acceptance.

04 / RECOVERY

No offer, no credit

Quiet time alone does not improve a retained score. The aging TODO was never implemented.

Answer to engineering's question: an explicitly declined ping and a missed ping receive the same history treatment in this code. Whether that was intended is a product-policy question, not something the code can authorize.

What we proved

- 16 controlled tests pass against unchanged routing source.
- All 1,696 observed outcomes were replayed under three initial-score assumptions; the severe four end at modeled zero.
- A responder can remain available/listed and still receive no offer when an earlier candidate accepts.

What we did not prove

- Actual historical scores, answer times, candidate sets or deployed version.
- That responders were automatically marked unavailable.
- That restoring 90 seconds restores already lost priority.
- That every lost offer was caused by this mechanism.

Reweighting reduced each miss's history contribution from 0.048 to 0.030; it did not increase the penalty mathematically. The timeout change and older recovery gap are distinct. Mechanism, source map and limits · Test evidence.

---

04 / BUILD THE WAY BACK

Dispatch Ready Review

Give Kip an explanation, Mite agency, and operations a bounded decision. Preserve history and shared availability; do not promise work.

HANDLER

Request a review

Inspect verified offer history and the Mite/Gale contrast.

RESPONDER

Confirm readiness

Explicitly confirm for this review, with the ability to pause.

OPERATIONS

Check fit and gear

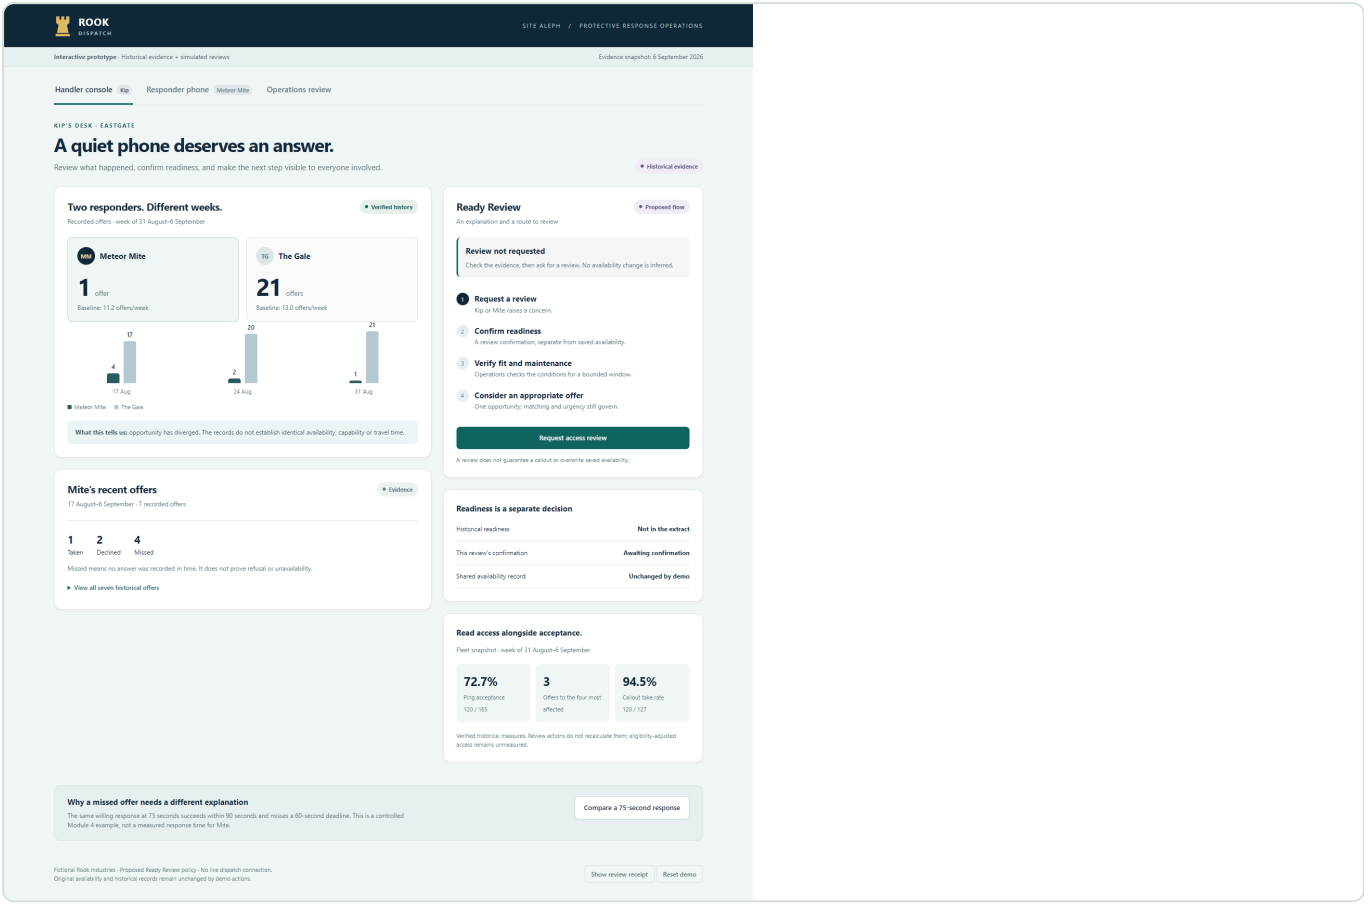

Availability, capability, region, travel, Supply maintenance.

BOUNDED PATH

Offer and receipt

Illustrate one appropriate opportunity; record outcome and follow-up.

Open the working prototype ↗ | Read the one-page brief | Inspect 23 browser checks

Actual browser capture of the prototype. Actions and incident fit are simulated; historical source evidence stays fixed. Open prototype.html locally after cloning or downloading the repo; GitHub's file view shows HTML source.

Five-minute walkthrough and decision boundaries

PROPOSED OWNER	DECISION BEFORE ROLLOUT	WHY IT MATTERS
Helen / Product	Approve scope, recovery policy and pilot boundaries.	Do not confuse prototype completion with launch approval.
Marcus + Wen	Validate hard eligibility, timing, recovery and rollback.	Capability is soft-ranked in supplied code; omitted adapters may enforce eligibility.
Supply owner	Verify the actual availability/maintenance contract.	A local Dispatch fix must preserve cross-product scheduling.
Ravi	Set numeric pilot and abort thresholds with real eligibility data.	Pair offer exposure with assignment latency and callout take rate.
Nadia + Sofia	Validate explanations, agency and operational workload.	A technically valid path must also be understood and usable.

Urgent protective-equipment approval delays remain a parallel Supply escalation. Do not bury their severity under the more frequent Dispatch complaints. No colleague has been messaged; these are proposed assignments.

---

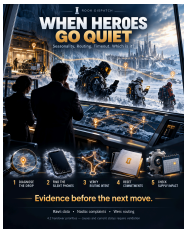

05 / YOUR QUESTIONS, THEIR RESULTS

Six modules. Six exact prompts. Six real results.

Each result below is paired with your recorded prompt in full. The sequence moves from an unproven handover to a measured service problem, a reproducible mechanism and a reviewable way back.

01 ORIGIN STORY

Executive field card

Your visual critique produced the executive reference card: diagnose the drop, find silent phones, verify routing intent, reconcile commitments, and check Supply. At onboarding, causation and recovery were still unverified.

YOUR EXACT PROMPT · SLOT 5

```
this lacks visual imagery, not relevant for executive audience with low attention span,
doesn't meet viral content criteria.
```

Open the artifact ↗ · Verify prompt wording · Supporting source

02 SUPER HEARING

147 tickets, 56 specific issues

147
tickets accounted for

56
specific issue groups

The broad summary became a specific classification: all 147 tickets assigned once across 56 issues. Thirty report missing or reduced offers; follow-ups are not independent customers.

YOUR EXACT PROMPT · SLOT 3

```
too broad and unclassified
```

Open the artifact ↗ · Verify prompt wording · Supporting source

03 REWIND

An improving average concealed lost access

Farlight, Vesper, The Undertow and Meteor Mite fall from 49 combined offers per week at baseline to three in the final week, while final-week acceptance reaches 72.7%. All 160 responder-weeks were retained.

YOUR EXACT PROMPT · SLOT 1

```
proceed with module 3 and work iteratively until completion. Use persona of native leader in this business space demonstrating rich business depth in decision making, verbiage, and deliverable (s) across all modules.
```

Open the artifact ↗ · Verify prompt wording · Supporting source

04 X RAY VISION

A willing answer can become a missed offer

75s

controlled answer time

90s window → taken

60s window → missed

The same controlled 75-second response succeeds with a 90-second window and misses with 60. Missed and declined both reduce history by 0.12; a listed responder can then lose future offers.

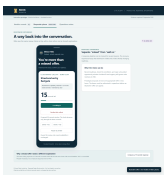

YOUR EXACT PROMPT · SLOT 1

```
Proceed with Module 4 and work iteratively until completion. Keep the same business-lead perspective and validate the routing mechanism against the Module 3 findings.
```

Open the artifact ↗ · Verify prompt wording · Supporting source

05 SUPER SPEED

A working route back into consideration

Dispatch Ready Review connects Kip, Mite and operations through explanation, readiness, five fit checks, one illustrative offer and a receipt. The prototype passes 23 browser checks; it is a proposed experience, not a deployed fix.

YOUR EXACT PROMPT · SLOT 1

```
Proceed with Module 5 and work iteratively until completion. Keep the same business-lead perspective and use the Module 4 handoff to create the product brief and working prototype.
```

Open the artifact ↗ · Verify prompt wording · Supporting source

06 SIDEKICKS

The decision habit became reusable

`Owner` `Outcome` `Scope` `Problem first`

2 actual runs · 4 flags

Review-checklist ran twice against four complete briefs. It found missing ownership, missing success criteria, scope drift and solution-first framing; the second run correctly produced a quiet unchanged result.

YOUR EXACT PROMPT · SLOT 1

```
Proceed with Module 6 and work iteratively until completion. Keep the same business-lead perspective and create the reusable review skill and scheduled workflow.
```

Open the artifact ↗ · Verify prompt wording · Supporting source

The quotations are copied from the six prompts.md files, including original casing and wording. Module 1 pairs your final visual critique with the resulting v2 card; Module 2 pairs your classification critique with the specific ticket taxonomy. Modules 3–6 quote your complete module instructions. Codex developed the detailed analysis and artifacts under those instructions; the SQL and generated image instructions are not being presented as prompts you typed.

06 / THE WORK CONTINUES WITHOUT RE-EXPLAINING IT

A review habit with evidence and memory of its last result.

Review-checklist asks whether each brief has accountable ownership, an observable measure, consistent scope and a problem established before the solution.

RUN 01 / ACTUAL MANUAL REVIEW

4 briefs · 4 flags

Complete first baseline, exact excerpts and all 16 judgments.

First run ↗

RUN 02 / ACTUAL MANUAL REVIEW

Same 4 flags · quiet delta

Fresh full-page reads under the revised skill. No manufactured new alerts.

Second run ↗

WEEKLY / REGISTERED ACTIVE

Monday · 08:00

App-local schedule in this chat. Chicago is intended; independent timezone confirmation and a future trigger remain operational follow-ups.

Schedule record ↗

BRIEF	FLAG	PRODUCT DECISION
Bulk Callout	No owner	Assign accountability or defer the commitment.
Approval Chains	Scope expands	Agree the first release boundary with Supply.
Override Audit Log	No success measure	Define whether support can trace disputed overrides.
Handler Phone App	Solution first	Establish awareness needs before committing to an app.

How this reduces the chance of repeating the decision failure

01 / OWNER

Make accountability explicit

Name the team or role that owns the commitment and the next decision. A stakeholder mention alone does not establish ownership.

02 / OUTCOME

Define what success means

Require an observable outcome rather than a feature list. For Dispatch recovery, use the responder-access scorecard alongside acceptance; the checklist alone does not select the right metric.

03 / SCOPE

Expose a changing promise

Compare the opening commitment with requirements and delivery scope. Flag material drift before the team commits to the expanded work.

04 / PROBLEM

Put evidence before the build

Establish the customer problem before prescribing an app, a setting or another solution. Keep assumptions visible for the decision-maker.

> **Prevention requires follow-through.** Review-checklist reviews product briefs; it does not monitor production routing, block releases or guarantee that this incident cannot recur. Ravi's responder-level measures, eligibility/delivery telemetry and engineering release/rollback validation are still needed.

Failure discipline: missing sources preserve the last complete baseline; source removal is not issue resolution; unchanged successful reviews stay quiet. Eighteen state-integrity tests passed. The helper validates evidence provenance and state, not the correctness of every semantic judgment.

Two actual manual runs meet the assignment's “ran twice” requirement. The provided scheduled-run-output.txt is a teaching example, not evidence of an actual run. The weekly trigger has not been observed. Revised-skill evidence · Validation limits.

---

07 / SUBMISSION AND GRADING EVIDENCE

Judge the work against the actual rubric.

The assignment supplies four qualitative criteria, not a formula that guarantees a score. This report makes the reasoning and evidence inspectable.

Application of Concepts

Business context, coded customer research, source disagreement, denominator-aware metrics, controlled code inspection, a working prototype and a reusable scheduled skill.

Six-module evidence chain

Credibility & Reasoning

Source snapshots, unique ticket IDs, exact quotations, raw database rows, zero-inclusive cohorts, unchanged source hashes and explicit causal limits.

Submission validation record

Clarity

An executive recommendation up front; separate facts, interpretations and proposals; one-page brief; clickable prototype; accessible report and navigable evidence.

One-page decision brief

Strategic Thinking

Restore appropriate access without promising allocation, protect incident assignment and Supply dependencies, and gate rollout on measurable service outcomes.

Tradeoffs and rollout gates

Required artifacts and administrative handoff

- Six original prompt libraries: 01, 02, 03, 04, 05, 06.
- Root AGENTS.md and original Rook source remain in place.
- brief.md, prototype.html, review-checklist/SKILL.md and this root **final-report.html**.
- Two actual skill runs and an active weekly schedule, with verification limits disclosed.

Submit the Public repository URL in the LMS section **Upload Your Codex for PMs Final Project**. A repo backup is not an LMS submission. No LMS submission has been made by this workflow.

Written-feedback window: seven days after the cohort ends. The final class shown is 12 November; if that is the cohort end, the seven-day date is 19 November 2026. Confirm the exact LMS cutoff.

Source: recorded official assignment and rubric. Full submission checklist includes status and pending administrative actions.

Open the Public course repo ↗ | Submission checklist

Readiness means the stated artifacts and evidence are present. It does not imply an instructor-awarded grade, certification issuance, live customer validation or production deployment.

Rook Industries is fictional. Student-directed coursework created with Codex. All sources and generated work remain within the course repository. Original source dates and evidence limits are retained.
