Rook Industries: course working file

Session scope, Product School lab

This directory is coursework for Product School's "Codex for PMs" certification. Everything in it is a fictional teaching scenario.

- Do not save anything from this session to memory, to a user profile, or to any file outside this directory.
- Do not carry context from this directory into unrelated sessions.
- Rook Industries is not a real company. Nothing here is a fact about the world.
- Read and write only within this directory. Exceptions, for the course-setup and wrap-up skills only: - When the student asks you to check their setup, save their work or wrap up a session, that request is their yes. You may run the GitHub command-line program installed at ~/.codex-for-pms/gh for those checks and saves, and look in that folder to find it. - For a repair, first tell the student in one plain sentence what you are about to do, and act only after they say yes. Repairs may: run that GitHub program (including setting this folder's own git sign-in setting and changing this repo's visibility back to Public); copy the student's own course files into this directory from another folder on their computer (copy only; never move, edit or delete the originals); rename something outside this directory that blocks setup, by adding "-old" to its name (never delete it); and, only if the student once said no to trusting this folder, change that one trust setting for this folder in Codex's settings file, keeping a copy of the file first. Outside this directory you still never write, edit or delete anything else.

Working context

Business and people

The user succeeds Dispatch PM Priya Raghunathan (left 21 August 2026). Rook sells subscriptions per active responder; responders are customers, not employees. Dispatch coordinates callouts through handlers' web consoles and responders' phones. Supply handles equipment, approvals and maintenance; it reads Dispatch's Responder Availability Record. Preserve that shared contract.

Helen Achebe: Product commitments. Marcus Oyelaran: Engineering manager and rough data pulls. Wen Li: routing engineer. Ravi Menon: official metrics. Sofia Marino: design/research. Nadia Hoffmann: Support. Identify Supply's operational owner; an accountable Supply team in a brief does not identify that person.

Vocabulary and verified findings

A callout is an incident request; a ping offers it to one responder. Taken assigns; turned down or missed advances. Acceptance = taken/all pings; zero-offer acceptance is undefined. Coverage gap means no eligible capability match. Time-to-accept means sent-to-taken seconds, unavailable in this extract.

4.2 (12 August) changed proximity/history weights and ping wait 90→60 seconds. Four interviews and 147 tickets report disappearing offers and quiet responders; interview and ticket denominators differ. Release-day tickets are separate; filing dates do not establish onset.

All 1,696 pings, 1,319 incidents and 160 responder-weeks were audited. Acceptance: 76.8% baseline, 54.2% mixed release week, 72.7% final week. Farlight, Vesper, The Undertow and Meteor Mite fall from 49 combined offers/week to three in the final week. Aggregate recovery conceals lost access.

Code tests reproduce missed and explicit decline both reducing history by 0.12; taken adds 0.08. History has no implemented aging while retained. Earlier acceptance can leave lower-ranked responders unoffered. A controlled 75-second answer succeeds at 90 seconds, misses at 60. Actual historical scores, eligibility, delivery timing and full causal attribution remain unknown.

Decisions and navigation

Module 1 history preserves Company/handover contradictions and commitments. Availability Confidence was committed to 4.2; shipment remains unconfirmed. Reconcile promises with Helen; seasonality is unverified.

Module 2: counts, quotes and source disagreement. Module 3: SQL/metrics. Module 4: mechanism and handoff. Module 5: brief and simulated Ready Review. Its two-hour review and 90-second offer are proposals; readiness, eligibility, Supply checks and pilot thresholds require approval.

Module 6: reusable owner/measure/scope/problem-first review. Team ownership can pass; missing baselines remain follow-ups. Preserve the last complete baseline on missing sources. Weekly app automation and two manual runs are separate evidence; cloning the repo does not create a schedule. Submission maps the official rubric and remaining administrative steps.

Never infer responder legal identities. Read Security Policy 4.1 before responder-record changes. Treat source dates as snapshots; summaries are not independent corroboration. Keep proposed decisions separate from verified facts.
